

Line Follower Drive Unit, Design Review

Internal sample report

Prepared for: NevoForge QA

Prepared by: Nwokolo Victor Oluebubechukwu

Date: 2026-07-21

1. Overview

This sample exercises every block the pipeline supports: headings, body text with **bold** and *italic* runs, tables, and figure placeholders.

2. Drive Unit

2.1 Motor Selection

The drive uses two N20 gearmotors at 6 V. Stall current was measured at 1.6 A per motor, so the driver must handle a combined 3.2 A worst case.

2.2 Fastener Summary

Size	Quantity	Location
M3 x 8	12	Chassis plate
M3 x 12	4	Motor mounts
M2 x 6	8	Sensor bracket

[Insert figure here]

Figure 1: Exploded view of the drive unit

3. Conclusion

The layout passes the checklist. Remaining concern: bearing seats need a tolerance check before the next print run.
